E-Store – Smart Electronics Store Backend System

E-Store is a backend project designed to automate the sales operations of electronics retail stores. Built with **NestJS** and **PostgreSQL**, the system leverages **TypeORM** along with various powerful libraries to ensure performance, scalability, and maintainability.

Key features include:

- **Robust authentication and authorization** system using JWT and role-based access control
- **Image upload functionality** via **Supabase Storage**
- **Email verification** and communication implemented using **Nodemailer**
- Clean and modular codebase following best practices
- RESTful API structure ready for frontend integration

The project is tailored for businesses aiming to digitalize and optimize their sales and product management processes in the electronics sector.

Avtosalon Admin Panel — Back-end

[Live Link](#) | [Github Link](#)

This project is a web-based admin panel developed for a car dealership business to streamline and automate administrative processes. Built using **Express.js**, **MongoDB** with **Mongoose**, and **JWT-based authentication**, it provides a secure and scalable solution for managing cars, users, and dealership operations.

Key features include:

- Secure **authentication and authorization**
- Modular and clean code structure for easy maintenance
- RESTful API endpoints for future frontend integration
- Designed for scalability and performance

The system is intended to help car dealership staff efficiently manage operations through a simple and user-friendly interface.

Personal Telegram bot

[Live Link](#) | [Github Link](#)

A multi-functional telegram bot that provides information about myself. Integrated AI assistant

FastFood- CRM panel

[Live Link](#) | [Github Link](#)

FastFood CRM – Backend System for Restaurant Management

Developed a scalable CRM system using **NestJS** and **PostgreSQL** to manage fast food restaurant operations. Features include **JWT-based authentication**, modular architecture, and easy integration with frontend/mobile apps. Built to streamline orders, customers, and staff workflows.

CRM panel for training centers

[Live Link](#) | [Github Link](#)

EduCRM – CRM Panel for Education Centers with Telegram Bot Integration

EduCRM is a custom-built CRM system designed to automate and simplify the management of education centers, including course tracking, student management, and communication. The project is developed using **NestJS**, with **PostgreSQL** as the database and **Prisma ORM** for efficient and type-safe data handling.

Key features include:

- **User authentication and secure login** with JWT
- **Modular and scalable architecture** tailored for educational institutions
- **Telegram bot integration** to receive real-time student or parent feedback and facilitate communication
- **RESTful API structure** ready for frontend and mobile extensions
- Designed for **administrators, teachers, and staff** to streamline their daily tasks and improve operational efficiency

This system aims to bridge the gap between management and communication through automation and cross-platform accessibility.
